

The Alexanders Swan Neck Partition™

What?

is the Alexanders
Swan Neck Partition

The Alexanders Swan Neck Partition is designed and manufactured in house from strong but lightweight 50mm tubular polished Stainless Steel, secured at four points in a H shaped format. The Nylon anti-rattle fastening bolts are easily opened and shut with generously sized toughened leather straps, while its 12mm GRP central body panel is padded on both sides with vinyl covered waterproof foam for added comfort, durability and safety.

Why?

is it so important to
passengers and horses

A good partition is not just for separating your horse, it should also provide protection and support in the course of travel. The swan neck shape, from which it derives its name, not only makes it harder for a horse to reach around and nip its neighbour but in the event of an unbalancing manoeuvre your horse is protected and stabilised, not only along its back but also up through its neck, by the contoured and fully padded partition. Further down, the PVC hanging kick mat helps stop stray hooves doing any damage.

Where?

is the Swan Neck
Partition located

The Alexanders Swan Neck Partition is as standard installed in the dead centre position of your horsebox, with its anti-rattle nylon fastening bolts firing securely into the floor, roof bar and bulkhead. However it can easily be moved to the far wall to create a box stall or marginally moved to one of the width adjustment points that are now standard on all models, to create just the right amount of space for your horse
